## What is this?

A template for beamer presentations. I made this template following RPI's official powerpoint template and logos [1].

## Why did I do this?

I couldn't find an existing one and I didn't want to copy over citations manually.

# Before We Start

- This project uses the `fontspec` package, which is not supported by the default compiler backend on Overleaf.
- You can change this by following the two steps:

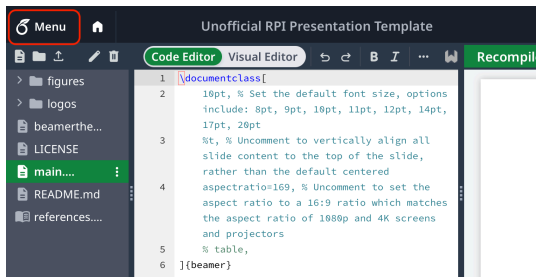

Figure: Open the menu tab

Figure: Set compiler to XeLaTeX

# Style Notes

---

- Use of `minipage` is encouraged.
  - Why? because I designed the template with it in mind. The `columns` env probably works for the most part as well, but it might not.
- I tried to use relative values for margins and header/sizes where I could. It should scale well with different page sizes.
- Just use `ref` for references. it's pretty annoying to get `cleveref` to work with beamer [2], and it doesn't look like there will be a nice way any time soon **<empty citation>**

- 6 Advanced Controls

# Table of Contents

---

- You already saw the table of contents.
- By default, it is in one column. If you want to divide it to multiple columns, you can use `minipage` or `columns` [3]
- To make use of this, you need to use sections, which should be placed outside of the frame [4].
- Use `AtBeginSection` to automatically show the table of contents at the beginning of each section.

# Using lists

---

Simple example of using lists.

- Item 1.
- Item 2.

1. Enumerate 1
2. Enumerate 2

I think this looks pretty similar to how the powerpoint one looks.

# A Table

Col 1	Col 2	Col 3
a	b	c
d	e	f

**Table:** An example table

## Findings

- This is indeed a table.
- Use minipage to put two things side by side, just like the images.
- You can also use columns, but it's not necessary [5].

- Footer Title Option/Override

# Textboxes

## First Block

- First item of first block.
- Second item of first block.
- Notice that the next block matches the height of this one.
- I am also changing the indentation of bullets so it looks better in the boxes.

## Second Block

- First item of second block.
  - first sub item of second block.

## Third Block

This one doesn't have a list and doesn't match the height!

# Equations

$$\mathcal{L}_{\text{CE}} = \sum_{c=1}^C \log \frac{\exp(x_{n,c})}{\sum_{i=1}^C \exp(x_{n,i})} \quad (1)$$

- Equation 1 shows the cross-entropy loss.
- You can also use inline equations like this:  $x_{n,c}$ .

# Definitions

## Definition

This is a definition.

- It can be used to define something.
- It can also be used to define something else.
- If you don't like the colors, you can change `block title` and `block body` of `setbeamercolor` in the `.sty` file.

# Using Bibtex

- It should be the same as using your regular bibtex.
- To showcase, let's cite some resources [6]–[8] that helped me put this together.
- You can add `[allowframebreaks]` to the frame to automatically continue the reference list in the text page if you have too many.
- You can use `\tcite` (short for `textcite`) shorthand to use it in *text* mode, i.e. Anglim [6].
- You can use `\fcite` (short for `footcite`) to add a citation with a footnote on the bottom of the slide.
  - Note that if you are using `\columns` or `\minipage`, the footnote will by default appear in the bottom of the *environment*, not the slide.
  - You can manually escape this by using just `\cite` or `\tcite` in text and adding a `\bfcite` (blank `footcite`) outside of these environments.
  - e.g. `\bfcite{fiandrinoAnswerDesignCustom2013}`.

  - Footer Title Option/Override

# Footer Title Option/Override

- The default behavior is to use the shorttitle (the stuff defined in [] after \title)
- You can change this by specifying an option when importing the template (like \usetheme[<OPTION\_HERE>]{rpi}). Valid options are:
  - footertitlemode=onlysection
  - footertitlemode=sectionandsubsection
  - footertitlemode=onlysubsection
- OR you can override it by using \overridefootertitle{<YOUR\_TITLE\_HERE>}. This will override the title for the rest of the presentation, until you call \clearoverridefootertitle.

## Another slide with custom footer title

---

# Placeholder slide to show resetting the footer title
